

Brief summary

In a virtual world, a robot is a program that is configured to perform repetitive actions. They are created in order to save a human from mechanical, monotonous work.

Robots for trading crypto currency are no different from the usual ones: they are set to trade mechanically on stock exchanges according to given parameters.

The simplest robots, which are most common, buy crypto-currencies at a rate drop and sell at growth

More complex robots use additional data and place orders only if these data are consistent with those indicated by the owner. For example, they can "view" the graph of the course of the Crypto currency for the last N days and start buying it if the chart shows a fall in the rate of 10-15%, but ignore the currency if the fall exceeds 25%. There are also complex robots that take into account dozens of indicators.

Mars terminal - a robot program built on the basis of Blockchain technology designed for the work on the stock exchange crypto currency trading and arbitration client. The developed conditions and an impressive number of variables and signals for Mars allows you to quickly and accurately develop trading algorithms for users. The round-the-clock maintenance of the program by experienced specialists allows you to bring program errors to a minimum, thereby increasing the profitability of using for the user.

The goal of the Mars Terminal team

The goal of the Mars team is to involve as many users in the region as possible, in particular, to the Crypto-Currency Exchange. But most people scare away the various complexities and risks associated with earning money on the crypto market. To solve this problem, a unique Mars program is created that is accessible to everyone and everyone thanks to its simple interface and operational support.

What is the Mars?

Mars terminal is a special program of artificial intelligence based on Blockchain technology built on algorithms and complex equations using hundreds of variables to extract strategies for inter-stock arbitrage, automatic and manual trading between exchanges on any pair of currency, trade transactions. The final version of the program will work on all known exchanges of crypto-currencies without the risk of blocking.

The main purpose of the Mars Terminal

The main purpose of Mars terminal is the instant calculation of the algorithm for transferring assets within or between multiple sites, taking into account exchange commissions, rates of crypto currency, transaction time and transaction security for obtaining the greatest benefits.

The Mars interface will have three modes of operation with the program:

Modes of operation Mars terminal:

1. Automatic
2. Semi-automatic
3. Manual

Let's examine each of these modes separately and in more detail.

Automatic mode allows the program to independently conduct inter-exchange transactions taking into account only the maximum transaction limit specified by the user.

In semi-automatic mode, Mars terminal requests the user's consent before each operation, offers a choice of alternative transactions. It is also required to specify several additional parameters.

Manual mode Mars terminal offers the user to independently conduct inter-exchange arbitrage, based on the proposed most profitable transaction algorithms.

In each of the modes of operation Mars terminal has its pros and cons based on which each user will choose the necessary work option for him. The user of Mars terminal can also adjust the level of risk / profit in transactions made by the program automatically.

Advantages of Mars

The program will have a very simple and functional interface, which is suitable even for a novice user.

24-hour online support for users on how to work with the program, both in chat and in the call mode.

Maximum security of operations and inter-exchange arbitrage crypto-risk - the risks tend to zero.

System of prompt response to signals. "Smart" filtering and signal verification.

Automatic calculation of forecasts.

Full protection of the user's personal data.

Regular updates in accordance with the wishes of users.

Ability to work offline with the help of an electronic cloud platform.

Compatibility of the program on Windows and Linux OS.

Functional mobile application.

Also planned release of various extensions to increase the functionality of Mars terminal.

Token AMT

The AMT token is an essential element in Mars. The program will be available to any user for free. The AMT token is used as a "fuel" for the commission to work with Mars

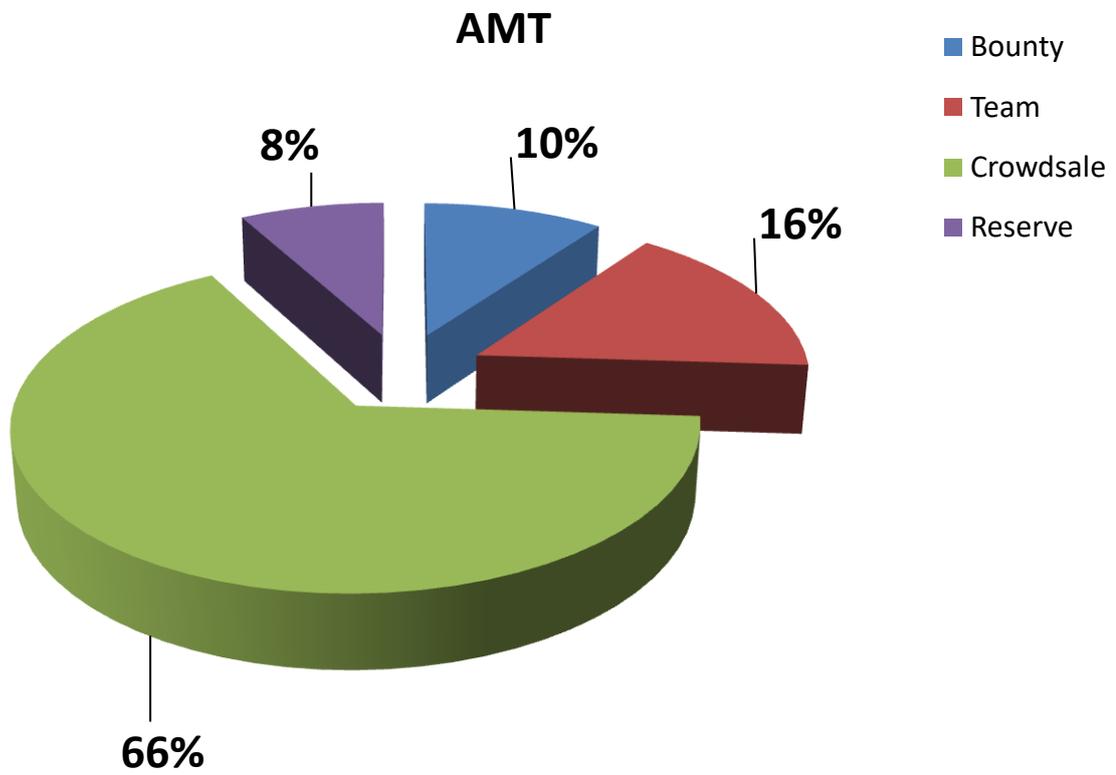

The user who installed MARS, for work in it, downloads the AMT tokens into the integrated wallet and uses them as a commission payment for using Mars. Tokens received by the program as a commission are excluded from circulation, which increases the demand for AMT users of crypto-exchange exchanges and increases their market value. The Mars commission is regulated depending on the number of AMT in free circulation. Re-release of tokens is done on a scheduled basis when the minimum threshold value of their number is reached in free circulation on the market.

This strategy will save AMT from the negative influence of the market and allow it to grow harmoniously in value even in the context of the general trend of the market decline.

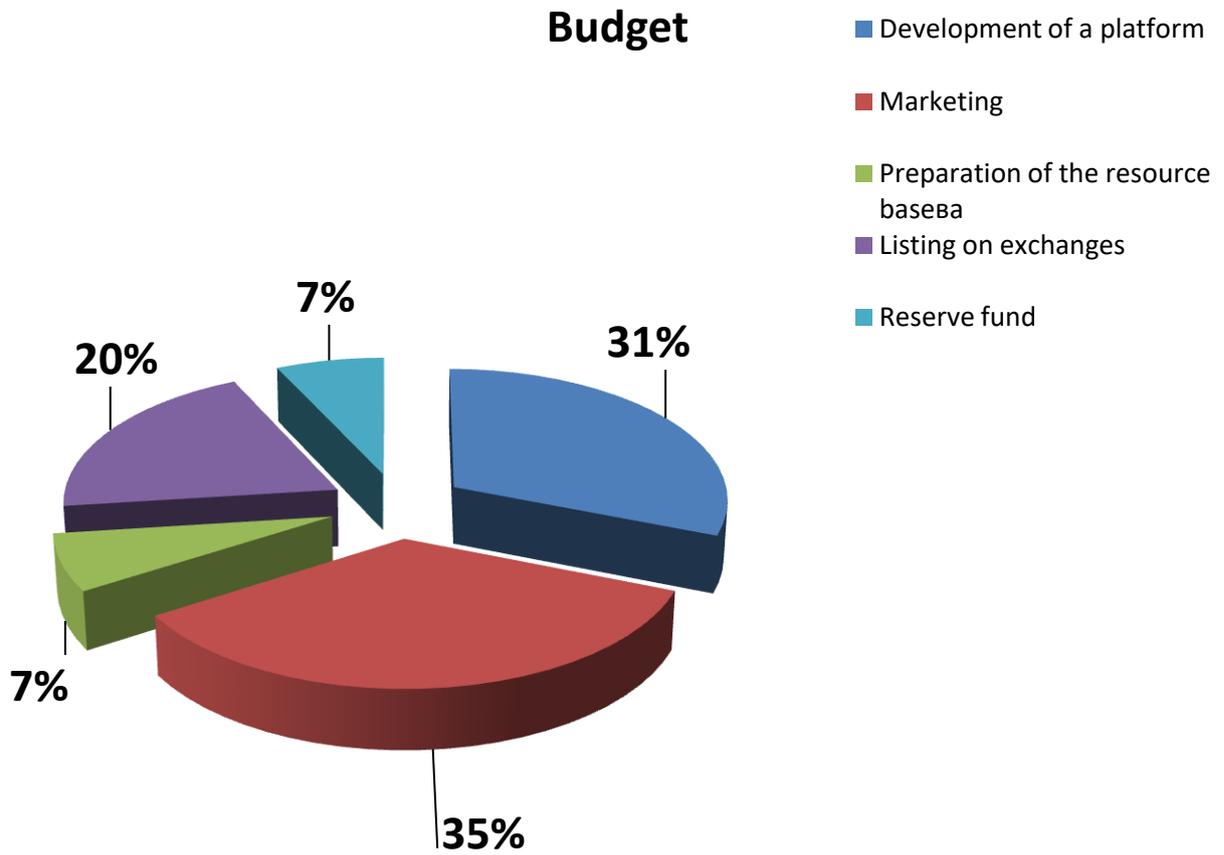

Distribution of the AMT token

Budget allocation.

Crowdsale.

The starting date of the crowdsale is assigned to 20.05.2018. Fundraising and the release of AMT tokens is designed to finance the marketing and advertising of the Mars platform, as well as software platform development. AMT tokens will be used to pay commission within the Mars platform.

The token contract conforms to the ERC20 standard, examine it on [Etherscan.io](https://etherscan.io)

Selling tokens 56 days.

Soft Cap - 34 Ether

Hard Cap - 7428 Ether

Cost of 1 AMT = 0.001 Ether

Bonus:

1 - 2 weeks - (+50%)

3 - 4 weeks - (+25%)

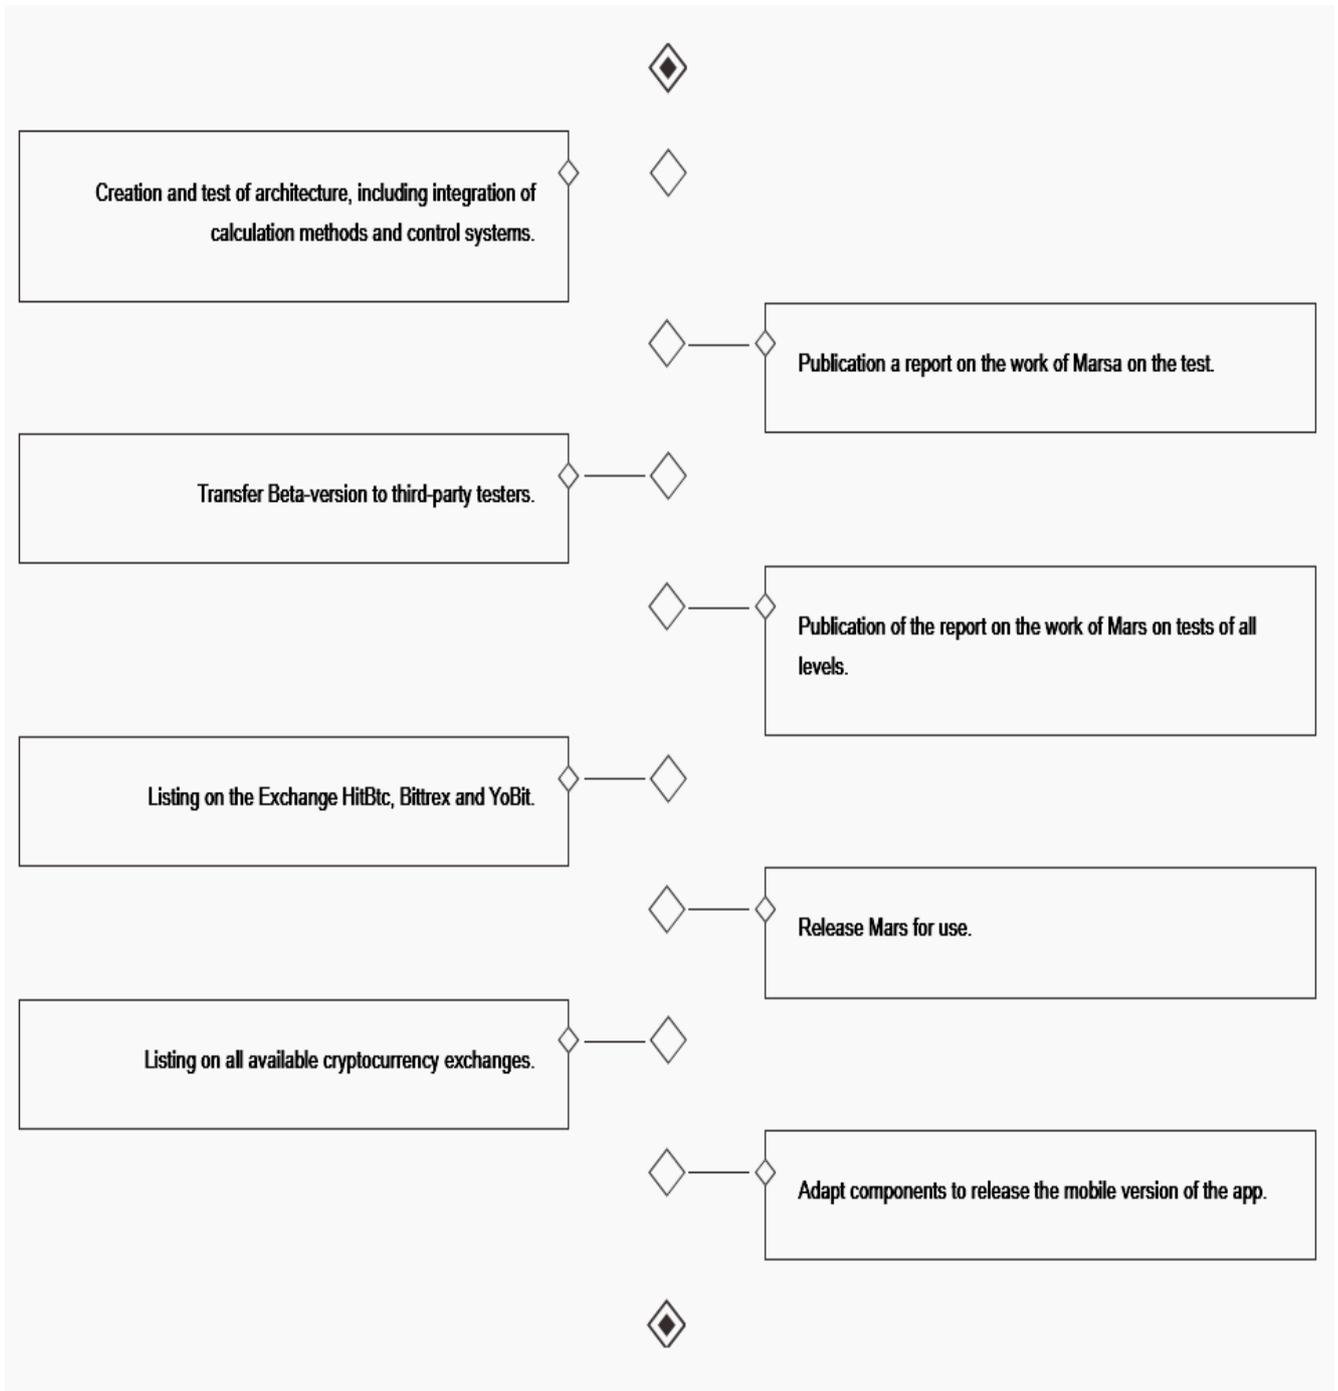

5 - 6 weeks - (+10%)

* If the soft cap is not reached, the funds will be returned to the participants.

Tokens selected as awards for the team will be frozen for 1 year after the completion of the crowdsale.
